

MODULE PRACTICE

Comments

```
// This is a single-line comment
```

```
/*  
This  
comment  
uses  
multiple  
lines  
*/
```

Comments are used to document what is happening inside of a program and are ignored by the compiler.

A single-line comment is used to write a comment on one line, while a multiline comment is used to write longer comments that span over multiple lines.

Print Statements

```
println("Greetings, earthling!")
print("Take me to ")
print("your leader.")

/*
Prints:
Greetings, earthling!
Take me to your leader.
*/
```

A print statement outputs values to the output terminal.

Using a `println()` statement will create a new line in the output terminal after printing values, while a `print()` statement will not.

Order of Execution

```
fun main() {
    println("I will be printed first.")
    println("I will be printed second.")
    println("I will be printed third.")
}
```

Code is read, compiled, and executed in top-down order.

The `main()` Function

```
fun main() {  
    // Code goes here  
}
```

The `main()` function is the starting off point of every Kotlin program and must be included in the code before execution.
